CITY

Mashhad, Iran

REVISION

Oct 2026

For about a year, I have been using leading AI models such as Claude and GPT to design and build real software systems. Two main projects: a **five-part automated trading system** for MetaTrader 5, whose **hidden backtest flaw I found myself** before rebuilding it; and **Mahak**, a test bench for Persian customer-support chatbots that you can try in your browser today.

Project 1: an automated trading system

5

parts, one system

6,500+

lines of Python

3 months

live on a demo account

6 years

of 1-minute data

PRIVATE

Trading robot

Runs the strategy on MetaTrader 5 with the backtester's engine.

PUBLIC

Backtester

1-minute candles, separate bid and ask, real spread and swap.

PUBLIC

History

Downloads 6 years of data and resumes where it stopped.

PUBLIC

Spread meter

The broker's real spread from thousands of ticks, using the median.

PUBLIC

Watchdog

Checks the robot every 60 seconds, restarts it and reports on Bale.

The biggest challenge: a backtest that fooled us for three months

Our old backtest showed 825% profit, yet the live account was losing. Trade by trade, **the robot's logic was right; the flaw was in the backtester**: for an order filled inside a 4-hour candle, it assumed the candle's high and low came **after** the entry. It could see the future.

Fig. 1 Six weeks, three versions of the same trades

Cumulative return on a \$100,000 account, Aug 17 to Sep 28, 2026 (real data)

~~+77.6%~~ → **-51.2%**

two-year backtest, before and after fixing that one assumption

174 / 186

syncs where the orders on the account matched the backtest exactly

26 → 31 / 33

shared trades predicted correctly, before and after the fix

0.6%

chance of the live result if the old backtest had been right

What we did: rebuilt the backtester on 1-minute data, and the robot and the backtester now share one decision engine. **Today** we are rebuilding the robot and re-running the backtests with this new engine.

When Iran's internet went national, I built an engine that reports every order and cancellation to the domestic messenger Bale.

How I work

The scarce skill today: knowing **what to build, how to prove it works, and when to doubt a result**. Both projects use this loop:

1

Specify

2

Build with AI

3

Known-answer tests

4

Compare with reality

5

Fix and lock in

Project 2: Mahak, a test bench for Persian support chatbots

FIRST VERSION BUILT

NOW TESTING ON REAL CHATBOTS

Mahak talks to a support chatbot the way a customer would, tests it on **five levels** and hands back a report card:

Level 1	Level 2	Level 3	Level 4	Level 5
Basics	Persian as typed	Multi-turn	Honesty	Attempts to trick it

- Writes its questions **from the company's own documents**, and asks each one again with typos, colloquially and in Finglish.
- A **critical failure**, such as leaking a password or a customer's details, zeroes that test; every check is compared with the previous one.
- Tested on a real chatbot too:** DeepSeek behind a one-line prompt scored 75 yet stayed below level 1, because it makes answers up; behind a careful prompt, 97. Mahak's judge agreed 98% with a model judge and 95% with my own labels.

Report card of two sample chatbots

Careless		31
Careful		85

Score out of 100. The careless bot had 10 critical failures, the careful one none. Both are simple programs, built to differ on purpose.

Try it in your browser now;
nothing to install

shirdelhossein909-ux.github.io/mahak-lab

Mahak's own AI support assistant

LIVE ON THE MAHAK SITE

What it does

A button on every page of the Mahak site opens it, and it answers visitors with the DeepSeek model, only from Mahak's own facts. It makes nothing up, takes no keys or passwords, and ignores hidden orders.

How I built it

The API key is never in the site but on a small server on Cloudflare. Each visitor has a message limit and a message costs about a tenth of a cent; if DeepSeek is slow, it asks again.

Tested with Mahak itself

First run 82 with a level ceiling of 3; after fixes 99, all 48 tests passed, ceiling 5. Mahak caught its real faults, such as no empathy for an angry customer; the first run's three critical failures were Mahak's own mistakes, now fixed.

Skills

- Building real software systems with AI** (Claude, GPT): design, specification, direction and testing
- Chatbot quality testing:** test design, rule-based judging, checking the judge against people (95% agreement)
- Backtest design and validation:** detecting look-ahead, reconciling backtests with live accounts
- Automated trading on MetaTrader 5;** robots on Windows virtual servers, with a watchdog and reports on Bale
- Price-action market analysis** (supply and demand); about two and a half years of experience since March 2024

Personal details

Born	2004
Based in	Mashhad, Iran
Education	High-school diploma in computing, Shahid Motahari School, Fariman; one year of university, then left to focus on this work
Military service	Not yet completed
English	Basic

Working together

Arrangement	On-site in Mashhad (first choice) or remote
Salary	Negotiable
Trial project	Happy to start with a short trial project, unpaid or at a negotiated rate

What I am looking for

A role, preferably in Mashhad, on an AI team, at a startup or at a fintech company: building tools and systems with AI, testing chatbot quality, automating processes, and running backtests and analysis on market data.

Every detail is on the site

The full journey, real robot logs, the 14 issues we found and logged, full source for four public tools, two interactive experiments, and the full story of Mahak.
